CS61A: Lecture #29

### Lecture 29: SQL Aggregation and Recursion

possible combinations of rows from those tables Abstractly, a select statement that lists multiple tables filters all

```
\frac{d}{d} = \frac{d}{d} = \frac{d}{d} = \frac{d}{d}
                                                                                select 1 as val union select 2;
> select T1.val, T2.val from T1, T2;
                                                                                                                          > create table T2 as
                                                                                                                                              > create table T1 as
select "a" as val union select "b";
```

Last modified: Mon Apr 10 15:28:02 2017

CS61A: Lecture #29 2

### Comparison to Python

```
This includes the case where the same table is named twice, as in
<u>a</u>
a
                                     select A.val, B.val from T1 as A, T1 as B;
```

```
<u>ხ</u>
         <u>а</u>
```

<u>d</u>

Thus, the select ... from .. a list comprehension in Python: from ... part is rather like the for part of

```
[ (A.val, B.val) for A in T1 for
B in T1
```

The where clause is now a filter, like the if clause in a list comprehension.

```
. is like
                                                                   <u>ф</u>
                                                                                                                 <u>a</u>
a
[ (A.val, B.val) for A in T1 for B in T1 if A.val <= B.val ]
                                                                                                                                                             select A.val, B.val from T1 as A, T1 as
                                                                                                                                         where A.val <= B.val;
```

Last modified: Mon Apr 10 15:28:02 2017

CS61A: Lecture #29

#### **Expressions**

```
Familiar arithmetic is possible:
```

```
6.7
                                           select 3+GP from grade_values;
                                                                   select 3 + 4;
```

Also string operations (not quite like Python):

6.3

```
Jason Knowles
Valerie Chan
                                    > select First || " " || Last from students;
```

Last modified: Mon Apr 10 15:28:02 2017

CS61A: Lecture #29 4

#### **Aggregation**

# Certain expressions aggregate results:

```
4
                                     V
                                                      3.7
                                                                                                                                           3.25
                                                                           > select max(GP) from grades,
where Letter=Grade and SI
                                                                                                                                                           > select avg(GP) from grades, grade_values
where Letter=Grade and SID = 101;
              select count(GP) from grades, grade_values
where Letter=Grade and SID = 101;
                                                                             and SID = 101;
                                                                                             grade_values
```

### Local Tables

- SQL provides a way to create (essentially) a temporary table for use in one select.
- Analogous to the let expression in Scheme
- Here, foreigner is a one-column table local to this statement

```
Last modified: Mon Apr 10 15:28:02 2017
                                                                                   What does this do?
                                                                                                           select child from people, foreigner
where people.parent = foreigner.person;
                                                                                                                                                                    with foreigner(person) as (
    select "Martin" union
                                                                                                                                               select "Johanna"
                                                                                                                                                         "Christina"
                                                                                                                     George
Johanna
                                        Martin F
Martin F
                            Donald
                                                                                                                                                           Martin
                                                                 Martin F
                                                                                                       George N
                                                                                                                                               Christina
                                                                             George N
                                                                                            George N
                                                                                                                                                                       parent

Donald
                                                                              John
                                                                                            Ann
                                                                                                                                             George
                                                                George N
                                                                                                                                                            George
                                                                                                                                                                          child
```

Last modified: Mon Apr 10 15:28:02 2017

C561A: Lecture #29

## Example: Ancestry Relationships

- What does the program on the left do?
- (distinct removes duplicate rows.)

```
with kin(first, second) as (
select a.child, b.child
from people as a, people as b
where a.parent = b.parent
and a.child != b.child )
select distinct kin.second, child
from people, kin
where kin.first = parent;
```

```
Martin F
Martin F
Martin F
                          George N
George N
George N
                                                                    Martin
                                                       George
Donald
                                                 Johanna
                                                              Christina
                                                                                    people
Peter
            George N
Robert
                                                Martin F
                                         Paul
                                                       Martin F
      Donald
                            John
                                                                    George
                                   Ann
                                                               George
                                                                             child
```

As with Python, Scheme, and streams, (limited) recursion is possible in SQL using the with clause.

Recursion, Yet Again

General form:

```
table_name(column_names) as (
    select ... union -- Base case
    select ... union -- Base case
    select ... from ..., table_name, ...
)
select ...
```

- The recursively defined table must appear only once in the from clause of the last select in the with clause.
- Because of these restrictions, no mutual recursions or tree recursions are allowed.

CS61A: Lecture #29 7

CS61A: Lecture #29 8

#### Example: Integers

Last modified: Mon Apr 10 15:28:02 2017

Define the table ints to contain integers from 1-30:

```
create table ints as
with ints(n) as (
    select 1 union
    select n+1 from ints where n<=30
)
select n from ints;</pre>
```

- Here, I've chosen to use ints for both the local and global tables.
- Usual sort of scope rules apply: the local ints is distinct from the global one, so I didn't have to make up a new name.

Last modified: Mon Apr 10 15:28:02 2017

CS61A: Lecture #29 9

Last modified: Mon Apr 10 15:28:02 2017

CS61A: Lecture #29 10

## Defining Ancestor Recursively

• An ancestor is a parent or an ancestor of a parent.

```
with
related(ancestor, descendant) as (
    select parent, child from people union
    select ancestor, child from related, people
    where descendant = parent
)
select ancestor from related where descendant = "Paul";
select ancestor from related where descendant = "Paul";
```

#### A Famous Number

- There is a famous story about the "interesting' number 1729, the first of the "taxicab numbers."
- The story told by G. H. Hardy describes a meeting between him and Srinivasa Ramanujan:

"I remember once going to see [Ramanujan] when he was lying ill at Putney. I had ridden in taxi-cab No. 1729, and remarked that the number seemed to be rather a dull one, and that I hoped it was not an unfavourable omen. 'No,' he replied, 'it is a very interesting number; it is the smallest [integer] number expressible as the sum of two [positive] cubes in two different ways.'"

 Given our table ints (numbers up to 50) how do we find such numbers?

#### Solution

```
with cubes(a, b, c) as (
    select x.n, y.n, x.n*x.n*x.n + y.n*y.n*y.n
    from ints as x, ints as y where x.n <= y.n
)
select left.a, left.b, right.a, right.b, left.c
    from cubes as left, cubes as right
    where left.a < right.a and left.c = right.c;</pre>
```
